# Crystal and molecular structure of Rebek's imide 

Xiuchun Gao, ${ }^{(1)}$ Tomislav Friščić, ${ }^{(1)}$ Giannis S. Papaefstathiou, ${ }^{(1)}$ and Leonard R. MacGillivray ${ }^{(1) *}$

Received May 15, 2003
The crystal and molecular structure of Rebek's imide $\mathbf{1}$ is reported. Crystal data for $\mathbf{1}$ : triclinic, space group $P \overline{1}, a=7.8733(7) \AA, b=12.712(1) \AA, c=12.789(1) \AA, \alpha=$ $86.628(5)^{\circ}, \beta=84.628(5)^{\circ}, \gamma=72.981(5)^{\circ}, V=1217.9(2) \AA^{3}$, and $D_{c}=1.305 \mathrm{~g} / \mathrm{cm}^{3}$ for $Z=2$ and $R=0.047$. The molecule crystallizes as a cyclic, hydrogen-bonded dimer held together by two $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and two $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds involving amide $\cdots$ carboxylic acid interactions. The dimer organizes in the solid state to form 1D ribbons.

[^0]
## Introduction

Rebek's imide 1, ${ }^{1}$ a derivative of Kemp's triacid, ${ }^{2}$ was developed in the mid-1980s as a platform for studies in molecular recognition. Derivatives of $\mathbf{1}$ have been used, for example, as model receptors for adenine derivatives, ${ }^{3}$ as templates to direct reactivity, ${ }^{4}$ and as receptacles to study acid-base interactions. ${ }^{5}$ Such studies have, in part, been achieved owing to a ready ability to functionalize the cleft-shaped molecule with convergent functional groups able to participate in hydrogen bonding, $\pi-\pi$ interactions, and coordination bonds. ${ }^{1}$

Although a large number of derivatives of Rebek's imide have been reported, we were surprised to discover that $\mathbf{1}$ has not been crystallographically characterized. In this paper, we report the crystal and molecular structure of $\mathbf{1}$.

[^1]
## Experimental

## Synthesis

All reagents were purchased from Aldrich Chemical Co. and were used as received, unless otherwise stated. 1 was prepared according to the literature. ${ }^{6}$ Single-crystals of $\mathbf{1}$ suitable for X-ray analysis were obtained by slowly cooling a warm aqueous solution of $\mathbf{1}$ to room temperature and letting the solution stand for a period of approximately 1 day.

## X-ray crystallography

A single crystal of $\mathbf{1}$ was mounted on the end of a glass fiber and optically centered in the X-ray beam of a Nonius Kappa system for data collection. Cell constants were calculated from reflections obtained from the data collection. The structure was solved using direct methods. After anistropic refinement of all non-hydrogen atoms, methylene, methyl, hydroxyl, and amide hydrogen atoms were placed in idealized positions

and allowed to ride on the atom to which they are attached. A summary of data collection parameters is given in Table 1. Structure solution was accomplished with the aid of SHELXS-86 ${ }^{7}$ and refinement was conducted using SHELXL93 ${ }^{8}$ locally implemented on a Pentium-based IBM compatible computer. All crystallographic manipulations were performed with the aid of RES2INS. ${ }^{9}$

## Results and discussion

Final positional coordinates and interatomic bond distances and angles are given in Tables 2 and 3 , respectively.

An ORTEP perspective of $\mathbf{1}$ is shown in Fig. 1. The asymmetric unit contains two full molecules of $\mathbf{1}$ (molecules A and B). Each molecule self-assembles to form a discrete hydrogen-bonded dimer, which sits around a crystallographic center of inversion, held together by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds. The

Fig. 1. ORTEP perspectives of 1: (a) molecule A and (b) molecule B. Thermal ellipsoids of non-hydrogen atoms are given at $30 \%$ probability level. Selected interatomic distances $(\AA)$ and angles $\left({ }^{\circ}\right): ~ O(4) \cdots \mathrm{O}(1)^{i}=2.718(2)$, $\mathrm{O}(4)-\mathrm{H}(4 \mathrm{O})=0.840, \quad \mathrm{H}(4 \mathrm{O}) \cdots \mathrm{O}(1)^{i}=1.886(2)$, $\mathrm{O}(4)-\mathrm{H}(4 \mathrm{O})-\mathrm{O}(1)^{i}=170.2(2), \mathrm{N}(1) \cdots \mathrm{O}(3)^{i}=2.834(3)$, $\mathrm{N}(1)-\mathrm{H}(1 \mathrm{~N})=0.880, \quad \mathrm{H}(1 \mathrm{~N}) \cdots \mathrm{O}(3)^{i}=1.993(2)$, $\mathrm{N}(1)-\mathrm{H}(1 \mathrm{~N})-\mathrm{O}(3)^{i}=159.6(2), \mathrm{O}(7) \cdots \mathrm{O}(6)^{i i}=2.711(3)$, $\mathrm{O}(7)-\mathrm{H}(7 \mathrm{O})=0.840, \quad \mathrm{H}(7 \mathrm{O}) \cdots \mathrm{O}(6)^{i i}=1.880(2)$, $\mathrm{O}(7)-\mathrm{H}(7 \mathrm{O})-\mathrm{O}(6)^{i i}=169.9(2), \mathrm{N}(2) \cdots \mathrm{O}(8)^{i i}=2.831(3)$, $\mathrm{N}(2)-\mathrm{H}(2 \mathrm{~N})=0.880, \quad \mathrm{H}(2 \mathrm{~N}) \cdots \mathrm{O}(8)^{i i}=1.977(2)$, $\mathrm{N}(2)-\mathrm{H}(2 \mathrm{~N})-\mathrm{O}(8)^{i i}=163.4(2)$. Symmetry operators: $i$ : $-x+1,-y,-z-1 ; i i:-x+2,-y-1,-z$.
are located along the periphery of the assembly. Notably, the imide function of each molecule is approximately planar, the largest deviation of the imide atoms being $0.015 \AA$ and $0.027 \AA$ for nitrogen atoms in molecules A and B, respectively. Bond lengths [distances ( $\AA$ ): $\mathrm{C}=\mathrm{O}$ 1.216(4) (A), 1.216(4) (B); C-O 1.326(3) (A), $1.330(3)$ (B)] and angles [angles $\left({ }^{\circ}\right): \mathrm{O}-\mathrm{C}-\mathrm{O}$ 123.2(3) (A), 122.8(3) (B)] of the carboxyl groups are consistent with $\mathbf{1}$ being in the acid form. ${ }^{10}$

A view of the extended structure of $\mathbf{1}$ is shown in Fig. 2. The hydrogen-bonded dimers assemble in the solid state to form 1D ribbons.

Fig. 2. Space-filling view of the extended structure of $\mathbf{1}$ (molecules A and B shown in gray and black, respectively).

Each ribbon is composed of dimers oriented in a perpendicular fashion, wherein the methyl groups of each complex exhibit a "tongue-ingrove" fit with the imide and carboxylic acid functionality. Adjacent ribbons stack offset, along the crystallographic $a$-axis, such that the methyl groups are located above and below the hydrogen bonds.
